About Atlas

Atlas Academy is a technology academy for kids and teens in Richmond and Vancouver. Every course is designed and taught by engineers and designers working in the industry today, at companies like **EA, IBM and Confluent**.

Classes are small, so every student gets real time with their instructor. There is no copying steps off a screen: students learn why something works, then build it themselves.

Why families choose us

- ★ **Taught by people who do this for a living.**
  Designed and taught by engineers and designers working at EA, IBM and Confluent.
- ★ **They work it out, then build it.**
  No copying steps off a screen. When something breaks, students reason out why and fix it.
- ★ **No homework, no extra screen time.**
  Real learning, done in class. Evenings stay free.

Atlas Academy

AN ACADEMY FOR YOUNG ~~USERS~~ *builders* OF TECHNOLOGY

Software Engineering
3D Modelling & Animation

atlas-academy.ca

Our Story

Technology is moving faster than ever, but tech education for young people hasn't kept up. The gap is structural: demand for engineers far outpaces what schools can staff, so most students never learn from a working engineer before they choose what to study.

Atlas Academy was built to close that gap. Engineers and designers from EA, IBM and Confluent teach small classes in Richmond and Vancouver, turning young curiosity into real creative and technical skill.

One line on who the founders are, e.g. "Founded in 20XX by …"

The Atlas team. Engineers and designers from EA, IBM and Confluent.

What will they actually build?

Software Engineering

Students program a Raspberry Pi in Python, from their first blinking LED to the **Plant Monitor**: light, temperature, humidity and soil sensors reporting on a real plant. By Level 6 they build **their own AI agent** from the ground up.

3D Modelling & Animation

In Blender, the studio-grade tool used across film and games, students model, rig, light and animate their own original characters and environments.

Won't AI just do this?

The kids who direct AI best are the ones who understand how it's built.

"Miguel's quote goes here"

From first LED to their own AI agent

Software Engineering runs in six levels, so progress is visible term after term.

- **L1** **Intro to Software Engineering**
  LEDs, buttons and buzzers on a Raspberry Pi, in Python.
- **L2** **Interactive Programming and Sensors**
  The Plant Monitor: light, temperature, humidity and soil sensors.
- **L3** **Solving Problems with Algorithms**
  Sorting, grids and objects in their first big project.
- **L4** **Web and Internet Foundations**
  How the internet works, and building for the web.
- **L5** **The Backend**
  Their own social network: accounts, a database and an API.
- **L6** **Level 6 title**
  Their own AI agent, built from the ground up.

Small classes

Every student gets real time with an instructor, every class.
