About Atlas

Atlas Academy is a technology academy for kids and teens in Richmond and Vancouver. Every course is designed and taught by engineers and designers working in the industry today, at companies like **EA, IBM and Confluent**.

Classes are small, so every student gets real time with their instructor. There is no copying steps off a screen: students learn why something works, then build it themselves.

Why families choose us

- ★ **Taught by people who do this for a living.**
  Designed and taught by engineers and designers working at EA, IBM and Confluent.
- ★ **They work it out, then build it.**
  No copying steps off a screen. When something breaks, students reason out why and fix it.
- ★ **No homework, no extra screen time.**
  Real learning, done in class. Evenings stay free.

See what your child could build before you enrol.

Save your child's spot

Classes are kept small, so places fill each term. Reach us today and we'll find the right level for your child.

1. **Call or email to enrol**

Won't AI just do this?

The kids who direct AI best are the ones who understand how it's built. That's why our students start with real code on real hardware, and by Level 6 build their own AI agent from the ground up.

Who teaches

Engineers working in the industry today, at **EA, IBM and Confluent**. Classes stay small, so every student gets real time with them.

The Atlas team. Engineers and designers from EA, IBM and Confluent.

Is Software Engineering right for my child?

"My kid isn't a tech kid."

They don't need to be. Level 1 starts with lighting a single LED.

Grit and resilience

When a sensor misses a reading, they figure out why. That's debugging, and it's resilience.

Critical thinking

To build the Plant Monitor, students decide what each sensor should measure, how often, and what counts as a warning. One big problem, broken into small steps.

Self-directed learning

No copying steps off a screen. At Level 5, students design how their own social network stores accounts, posts and friendships.

"Miguel's quote goes here"

What will they actually build?

L1 **Intro to Software Engineering**
LEDs, buttons and buzzers on a Raspberry Pi, in Python.

L2 **Interactive Programming and Sensors**
The Plant Monitor: light, temperature, humidity and soil sensors.

L3 **Solving Problems with Algorithms**
Sorting, grids and objects in their first big project.

L4 **Web and Internet Foundations**
How the internet works, and building for the web.

L5 **The Backend**
Their own social network: accounts, a database and an API.

L6 **Level 6 title**
Their own AI agent, built from the ground up.
