Our Story

Technology is moving faster than ever, yet quality tech education for youth has lagged behind. Atlas Academy was created to change that.

The challenge in youth technology education is fundamentally structural. Because the demand for specialized technical talent vastly outpaces what general school systems can feasibly staff, students rarely get exposure to practicing engineers during their formative years.

Based in Richmond and serving the Greater Vancouver area, Atlas Academy combines professional industry standards with dynamic mentorship—turning young curiosity into true creative and technological capability.

How do I know if 3D Modelling & Animation is right for my child?

Sharpens Spatial Awareness and Math Skills

Designing objects in a digital space trains visual thinking and depth perception, giving them a real head start in math, architecture, and design.

Patience and Attention to Detail

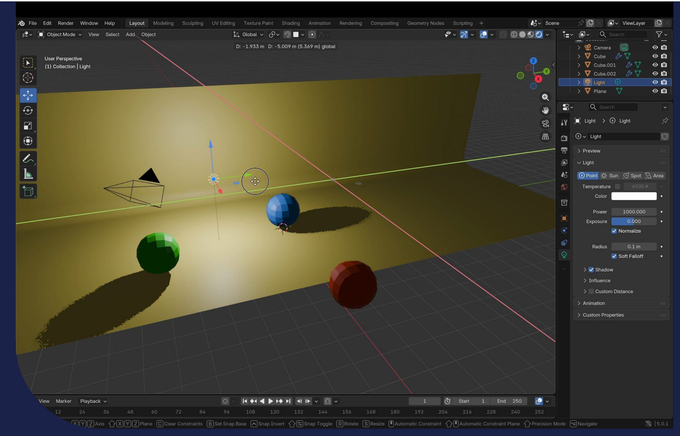

A 3D model only looks right when all the small pieces line up correctly. As kids adjust curves, align edges, and smooth surfaces, they naturally practice slowing down and checking their work.

Deepens How They Observe the Real World

This “way of seeing” shifts how they view their surroundings, turning everyday curiosity into an analytical eye for form, structure, and physics.

Education Principles

Kids learn best when they are actively exploring, not just sitting back and listening. At Atlas, we guide students to take pride in their own learning: giving each child the time, attention, and hands-on practice they need to truly master every concept before moving forward.
